

ECON 611

MAC USERS ONLY!

Startup:

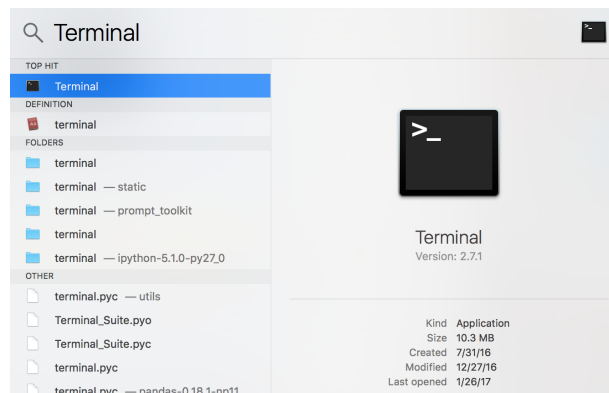

1. First open your **Terminal**

Terminal: is the application that allows you to navigate through your computer without using your mouse. You can open the Terminal by either:

- Option 1: opening Finder, then click Applications from the sidebar, then open Utilities, then open Terminal

- Option 2: holding Command key then press the Spacebar on your computer, then you can simply type Terminal and press Return

Once you open the terminal, your screen should now look similar to:

Part 1: Jupyter notebook & Anaconda:

From the “Required Tools For Class” document, you must have Anaconda already installed. If you have not done so, please complete this first: [Required Tools For Class](#)

To check if Anaconda is installed, type: **conda info** and Return in your *Terminal*. It should output something similar to:

```
jrcmalunay — -bash — 80x23
Justins-MacBook-Pro-4:~ jrcmalunay$ conda info
Using Anaconda Cloud api site https://api.anaconda.org
Current conda install:

  platform : osx-64
  conda version : 4.0.8
  conda-build version : 0+unknown
  python version : 2.7.11.final.0
  requests version : 2.9.1
  root environment : /Users/jrcmalunay/anaconda (writable)
  default environment : /Users/jrcmalunay/anaconda
  envs directories : /Users/jrcmalunay/anaconda/envs
  package cache : /Users/jrcmalunay/anaconda/pkgs
  channel URLs : https://repo.continuum.io/pkgs/free/osx-64/
                https://repo.continuum.io/pkgs/free/noarch/
                https://repo.continuum.io/pkgs/pro/osx-64/
                https://repo.continuum.io/pkgs/pro/noarch/
  config file : None
  is foreign system : False

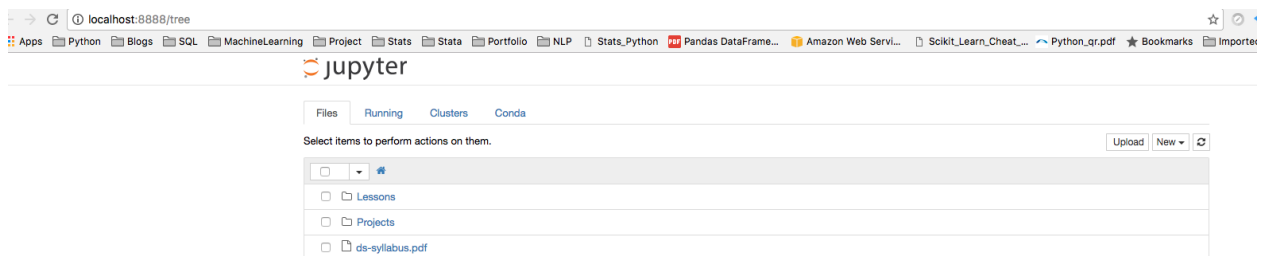

Justins-MacBook-Pro-4:~ jrcmalunay$
```

If you see this in Terminal, you are good to go. If not, you did **NOT** install Anaconda properly (if that is the case go back to the [Required Tools For Class](#) document).

1. Once the installation is done, in your terminal type: **jupyter notebook** and **press Enter** (see picture below)

```
DS-SF-31 — jupyter-notebook — 118x39
Javier@Marios-MacBook-Pro-2:~/Desktop/DS-SF-31$ jupyter notebook
[I 17:28:34.585 NotebookApp] [nb_conda_kernels] enabled, 2 kernels found
[I 17:28:35.156 NotebookApp] ✓ nbpresent HTML export ENABLED
[W 17:28:35.156 NotebookApp] x nbpresent PDF export DISABLED: No module named nbbrowserpdf.exporters.pdf
[I 17:28:35.161 NotebookApp] [nb_conda] enabled
[I 17:28:35.267 NotebookApp] [nb_anacondacloud] enabled
[I 17:28:35.274 NotebookApp] Serving notebooks from local directory: /Users/Javier/Desktop/DS-SF-31
[I 17:28:35.274 NotebookApp] 0 active kernels
[I 17:28:35.274 NotebookApp] The Jupyter Notebook is running at: http://localhost:8888/
[I 17:28:35.274 NotebookApp] Use Control-C to stop this server and shut down all kernels (twice to skip confirmation).
```

2. You should eventually see a **new** tab open up in your browser for you to begin using Jupyter Notebooks.

- a. Don't worry if your tab says something like "*Conda [Root]*" or "*Python Default*", either of these options will work fine. You can click on these to start a new python file.
3. Now we need to learn how to close the new tab on your browser. *Note the following lines were taken directly from the jupyter notebook beginner guide <http://jupyter-notebook-beginner-guide.readthedocs.io/en/latest/execute.html#shut-down-the-jupyter-notebook-app>:*
 - a. In a nutshell, closing the browser (or the tab) **will not close** the **Jupyter Notebook App**. To completely shut it down you need to **close the associated terminal**. In more detail, the **Jupyter Notebook App** is a server that appears in your browser at a default address (<http://localhost:8888>). Closing the browser will not shut down the server.

4. Go back to the terminal/command prompt where you previously typed jupyter notebook and use the **Control+C** keys to close the notebook (both keys should be press at the same time => see image below)

```
[I 11:32:58.918 NotebookApp] Use Control-C to stop this server and shut down all kernels (twice to skip confirmation).
```

5. If you did this correctly the following question will appear in your terminal: **Shutdown this notebook server (y/[n])?** => then type **y** and press **enter** => your notebook is now closed (see image below):

```
^C[I 11:37:27.482 NotebookApp] interrupted
Serving notebooks from local directory: /Users/Javier/Desktop/DS-SF-31
0 active kernels
The Jupyter Notebook is running at: http://localhost:8888/
Shutdown this notebook server (y/[n])? y
```

6. For more information on the Jupyter Notebook system see the [official documentation](#).
 - a. Additional information on Jupyter Notebook Manual
<https://athena.brynmawr.edu/jupyter/hub/dblank/public/Jupyter%20Notebook%20Users%20Manual.ipynb>

Part 2: Get familiar with GitHub

1. For information on Git please revise this links
 - a. <https://guides.github.com/activities/hello-world/>
 - b. <https://help.github.com/articles/git-and-github-learning-resources/>

Part 3: GitHub setup First-Time

1. Now we are going to navigate through Terminal
 - a. In the **Terminal** window type: **pwd** (pwd = print working directory)
 - b. type: **cd Desktop** (cd = change directory, in this case we need to change the directory to your Desktop)
 - c. type: **git config --list --show-origin**
 - i. If you have your GitHub already configured you should see something like this as an output in your terminal

```
Javier@Marios-MacBook-Pro-2:~/Desktop$ git config --list --show-origin
file:/usr/local/etc/gitconfig credential.helper=osxkeychain
file:/Users/Javier/.gitconfig push.default=simple
file:/Users/Javier/.gitconfig user.name=Mario Javier Carrillo
file:/Users/Javier/.gitconfig user.email=majacaci00@gmail.com
file:/Users/Javier/.gitconfig core.excludesfile=/Users/Javier/.gitignore_global
```

1. **If you didn't see the above output you need** to set your user name and email address. This is important because every Git commit uses this information, and it's immutably baked into the commits you start creating:
 - a. type: **git config --global user.name "YOUR NAME"**
 - b. type: **git config --global user.email "email address you use to create your GitHub repo"**
 - i. NOTE: it is more likely that you will be asked to enter your Username and Password or just the Password. When you enter the Username you will see in the

terminal the username you are entering (this is your email address). However, when entering the Password, the password is not echoed in the the terminal screen, but it is being recorded by the terminal.

Part 4: Create class directory

1. Now we are going to navigate through Terminal
 - a. In the **Terminal** window type: **pwd** (pwd = print working directory)
 - b. type: **cd Desktop** (cd = change directory, in this case we need to change the directory to your Desktop, and it is in here where we are going to allocate the **NEW** ECON611 folder)
 - c. type: **git clone** <https://github.com/majacaci00/ECON611>
 - d. type: **cd ECON611**
 - e. type: **git pull** (a message saying “Already up-to-date” should appear in your screen)

Part 5: Create your student repo

1. Access your GitHub account by going github.com
2. On the top right corner of your GitHub page, identify the + sign click on it and select create on *New repository* (see image)

3. A new window will open. In this window go to *Repository Name* and type ECON611-*MAJACACI00* (replace *MAJACACI00* with **your github username**)
4. On the *description* section type: “This is my ECON611 student repo”
5. Scroll to the bottom and make sure that *Public* is selected
6. *Select* Initialize this repository with a README
7. Click on *Create repository* (see image below)

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository](#).

Owner

Repository name *

Great repository names are short and memorable. Need inspiration? How about **fluffy-adventure**?

Description (optional)

This is my ECON611 student repo

- ☒  **Public**
Anyone can see this repository. You choose who can commit.
- ☐  **Private**
You choose who can see and commit to this repository.

Skip this step if you're importing an existing repository.

- ☒  **Initialize this repository with a README**
This will let you immediately clone the repository to your computer.

Add .gitignore: **None** ▼

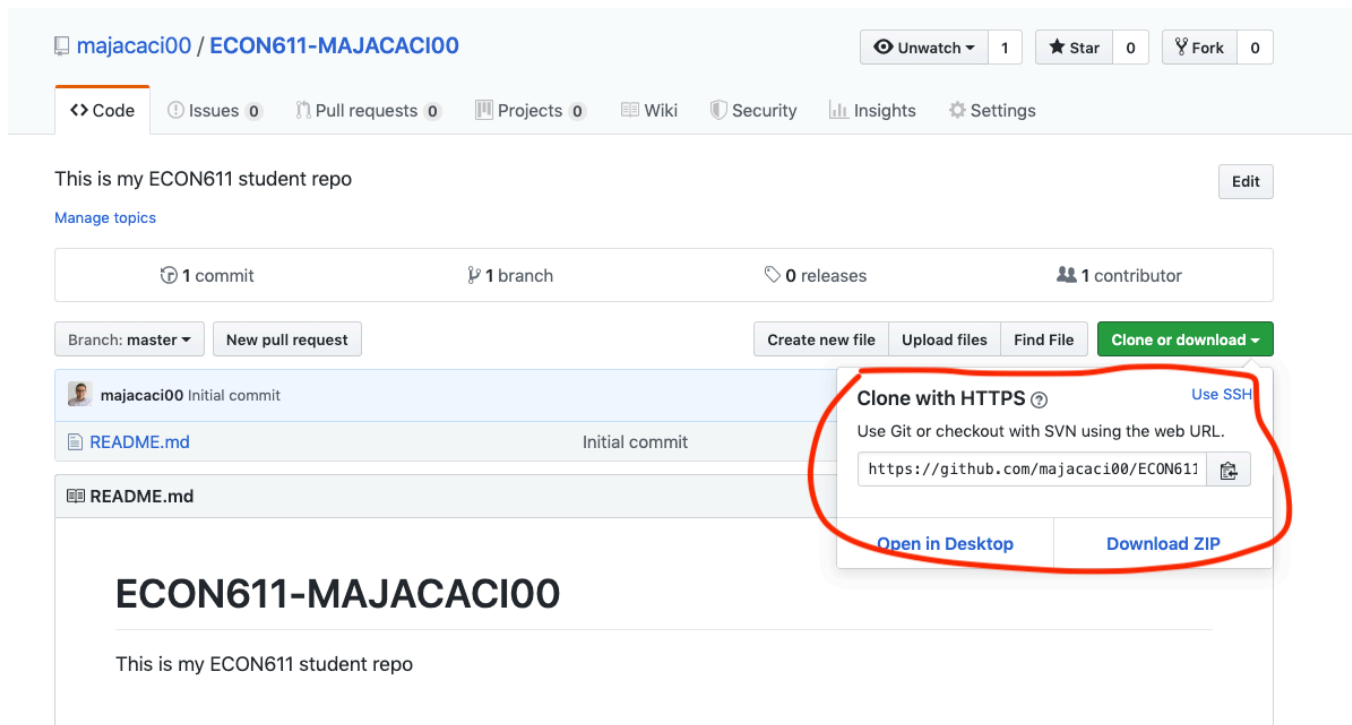

Add a license: **None** ▼

Create repository

Part 6: cloning your repo to your computer

1. Open the Terminal
2. Move from your home directory to your Desktop by typing: **cd Desktop** and press return
3. If you type **pwd** and press return, it should say something similar to **/Users/YOURNAME/Desktop**
4. Once you are in your desktop type: **git clone https://github.....** (this is the url from your ECON611-githubusername=> you can find this link if you click on the green button "Clone or download" => see picture below)

Part 7: pushing a document to your student repo

1. **MANUALLY** copy ANY pdf document into your ECON611-**githubusername**
 2. **MANUALLY** rename your pdf document to **test**
 3. Go back to your Terminal and **make** sure you are in the ECON611-**githubusername** folder.
 4. type: **git add test.pdf**
 5. type: **git status** (you should see your test.pdf under *Changes to be committed*: blablabla, also your file should appear *highlighted in green*)
 6. type: **git commit -m "testing my student repo"**
 7. type: **git push origin master**
 8. go to github.com (*refresh the site*) and you should see your test.pdf document
 9. **SUCCESS!**
- **NOTE:** if you see this file **.DS_store** in your terminal ignore it for now
 - **NOTE:** if you get an error --global config "bla bla bla bla" ignore all the warnings and push anyway. The terminal will throw you a message asking you to input the Username and Password to verify the credentials, which you need to do.

Part 7: Opening jupyter notebook

1. Open your Terminal
2. cd to your Desktop
3. type: jupyter notebook
